

Final Data Analysis Report

A professional, evidence-based analysis of fund performance, risk, investor behaviour, SIP activity, portfolio concentration and market trends

Figure: Historical NAV trend across the analyzed schemes, 2022–2026.

Prepared by Suraj Singh	Project Bluestock Fintech Data Analytics Internship	Report date 23 August 2026
----------------------------	---	-------------------------------

1. Executive Summary

The project combines cleaned mutual-fund, NAV, AUM, SIP, investor, portfolio and benchmark datasets into a single analytical view.

40 fund schemes analyzed	46,000 NAV observations	₹31,002 cr Dec-2025 SIP inflow	26.12 cr folios by Dec-2025	32,778 investor transactions	1,362 SIP investors eligible for continuity analysis
---------------------------------------	--------------------------------------	---	--	---	---

The analysis covers 40 schemes and 46,000 historical NAV observations, supported by fund-house AUM, monthly SIP, category inflows, folio counts, investor transactions, portfolio holdings and benchmark-index data. The supplied project documentation describes an end-to-end workflow from ingestion and cleaning through SQLite storage, exploratory analysis, advanced risk analytics, recommendation logic and Power BI reporting.

The strongest market-level signal is sustained expansion in systematic investing. Monthly SIP inflow increased from ₹11,517 crore in January 2022 to ₹31,002 crore in December 2025, while SIP AUM rose from ₹4.80 lakh crore to ₹15.90 lakh crore over the same endpoints. Total folios increased from 13.26 crore to 26.12 crore.

At scheme level, the supplied performance dataset shows an average 3-year return of 14.09%, average Sharpe ratio of 1.36 and average annualized standard deviation of 14.96%. SBI Small Cap Fund – Regular Plan – Growth has the highest 3-year return at 23.39%, while ICICI Pru Liquid Fund – Regular – Growth has the highest Sharpe ratio at 7.68.

Core interpretation

Growth in SIP inflows and folios is the clearest structural trend. At the same time, the fund-level analysis shows that return leadership and risk-adjusted leadership are not identical: the highest-return schemes are not necessarily the schemes with the highest Sharpe ratios.

2. Introduction

Purpose, analytical questions and scope

This project is an end-to-end mutual-fund analytics solution developed during the Bluestock Fintech Data Analytics Internship. Its purpose is to organize heterogeneous financial and investor datasets, validate and clean them, calculate performance and risk measures, and translate the results into decision-support insights.

Problem statement

Mutual-fund datasets combine scheme characteristics, historical NAVs, fund-house AUM, investor transactions, SIP flows, portfolio holdings and market benchmarks. A useful analytical solution therefore needs to connect these views while preserving data quality and making performance, risk and investor behaviour understandable.

Objectives

- Build a repeatable ingestion, cleaning, validation and database-loading workflow.
- Explore NAV, AUM, SIP, folio, category, investor and portfolio patterns.
- Compare schemes using return, risk-adjusted and benchmark-relative measures.
- Assess downside risk using maximum drawdown, VaR and CVaR.
- Analyze investor cohorts and SIP continuity.
- Measure portfolio sector concentration using HHI.
- Provide a simple risk-based fund recommender and an interactive Power BI dashboard.

Key analytical questions

- How did AUM, SIP inflows and folio counts change across the supplied periods?
- Which schemes lead on 3-year return, Sharpe ratio, alpha and composite score?
- Where does downside risk appear highest in the supplied risk outputs?
- What do investor demographics, transaction types and city tiers show?
- How strong is SIP continuity among eligible repeat-SIP investors?
- Which equity portfolios show comparatively high sector concentration?

Scope

The analysis is limited to the datasets and analytical outputs contained in the project ZIP. NAV and benchmark histories extend from January 2022 through May 2026; AUM is available through December 2025; monthly SIP inflows cover January 2022–December 2025; folio observations run from January 2022 through December 2025; investor transactions cover January 2024–May 2025; and portfolio holdings are dated 31 December 2025.

3. Dataset Description

Structure, coverage and important variables

10	87,533	15	19	8
core datasets	rows in SQLite database	fund-master columns	scheme-performance columns	portfolio-holding columns

Dataset	Rows	Main analytical role
Fund master	40	Scheme, category, plan, risk and fee attributes
NAV history	46,000	Historical NAV and return calculations
AUM by fund house	90	Fund-house AUM and scheme counts
Monthly SIP inflows	48	SIP inflow, accounts, AUM and YoY growth
Category inflows	144	Category/month net inflows
Industry folio count	21	Total and segment-level folio counts
Scheme performance	40	Return, Sharpe, Sortino, alpha, beta, drawdown and AUM
Investor transactions	32,778	Transaction, demographic, location and KYC attributes
Portfolio holdings	322	Stock, sector, weight and market-value information
Benchmark indices	8,050	Benchmark closing values for relative analysis

Important variables include AMFI scheme code, fund house, scheme name, category/sub-category, plan, benchmark, expense ratio and risk category in the fund master; NAV/date in NAV history; return horizons, benchmark return, alpha, beta, Sharpe, Sortino, volatility and drawdown in scheme performance; and transaction type, amount, state, city tier, age group, gender, income, payment mode and KYC status in investor transactions.

Structural note

The project documentation reports 10 analytical SQLite tables and 87,533 loaded rows. The raw directory also contains five selected-scheme API NAV files, which are treated as supporting project material rather than as a replacement for the core analytical datasets.

4. Data Cleaning & Preprocessing

Only transformations supported by the supplied scripts and outputs are described here.

The supplied cleaning script standardizes dates, sorts NAV observations by AMFI code and date, removes duplicates, forward-fills missing NAV values within scheme, and retains positive NAVs. Investor transactions are standardized for transaction type and KYC status, restricted to the three supported transaction types, filtered to positive amounts, and deduplicated. Scheme-performance numeric fields are coerced to numeric and duplicates are removed. The remaining datasets are deduplicated and date/month columns are converted where applicable.

Data-quality validation

- The fund master contains 40 records and 40 unique AMFI codes.
- NAV history contains 46,000 observations.
- The supplied quality script checks that every fund-master AMFI code is present in NAV history; the project README records that this check passed.
- The raw monthly SIP file contains 12 missing cells, corresponding to fields that are not populated for the earliest year-over-year comparison period; the processed file preserves the available values.

Before/after structure

Area	Raw / source state	Processing supported by project
NAV history	46,000 rows; date/NAV fields	Date conversion, sorting, duplicate removal, forward-fill by scheme, positive-NAV filter
Investor transactions	32,778 rows	Date/type/KYC standardization, valid-type and positive-amount filters, duplicate removal
Scheme performance	40 rows	Numeric coercion for performance/risk fields and duplicate removal
Other core files	Multiple CSV structures	Duplicate removal and date/month conversion where applicable

The cleaning stage is intentionally described conservatively: where the source files show a field as missing or where a transformation is not explicitly supported by the supplied scripts, no additional cleaning is claimed.

5. Exploratory Data Analysis — Market & Flow Trends

Market-scale indicators show sustained expansion across the supplied observation periods.

Figure 5.1 — AUM growth by fund house, 2022-2025. SBI Mutual Fund remains the largest fund house in the supplied AUM series.

Figure 5.2 — Monthly SIP inflow trend, January 2022–December 2025. December 2025 reaches ₹31,002 crore.

What the data shows

SBI Mutual Fund's AUM reaches 12.50 lakh crore in December 2025. Across the monthly SIP series, inflow rises 169.2% from January 2022 to December 2025.

5.1 Exploratory Data Analysis — Investors & Participation

Demographic and participation measures provide a complementary view of market expansion.

Figure 5.3 — Age-group and gender distribution in the investor transaction data. The 26-35 age group is the largest segment; male transactions account for 66.5% of records.

Figure 5.4 — Total mutual-fund folio count growth, January 2022–December 2025.

Participation signal

Total folios rise from 13.26 crore in January 2022 to 26.12 crore in December 2025, an increase of 97.0%.

6. Detailed Fund Performance

Return leadership, risk-adjusted performance and composite scoring tell different parts of the performance story.

Across the 40 schemes, the supplied scheme-performance table reports mean 1-year, 3-year and 5-year returns of 14.38%, 14.09% and 14.52%, respectively. The mean benchmark 3-year return is 12.84%, and mean alpha is 1.25.

Figure 6.1 — Ranking of schemes by 3-year CAGR/return measure in the supplied performance analysis.

Scheme	3-year return
SBI Small Cap Fund - Regular Plan - Growth	23.39%
SBI Small Cap Fund - Direct Plan - Growth	23.14%
ABSL Small Cap Fund - Regular - Growth	22.38%
Axis Small Cap Fund - Regular - Growth	20.98%
Nippon India Small Cap Fund - Regular - Growth	20.15%

Return leader

SBI Small Cap Fund – Regular Plan – Growth records the highest 3-year return in the supplied scheme-performance dataset at 23.39%. The next two are the corresponding SBI Small Cap Direct plan at 23.14% and ABSL Small Cap Fund – Regular at 22.38%.

6.1 Risk-Adjusted Performance

Sharpe, Sortino and alpha provide distinct perspectives on efficiency and benchmark-relative value.

Figure 6.2 — Top schemes by Sharpe and Sortino ratio in the supplied analysis.

Measure	Mean	Maximum
Sharpe ratio	1.36	7.68
Sortino ratio	2.08	10.37
Alpha	1.25	1.98
Beta	0.87	1.04
Annualized standard deviation	14.96	25.00

Risk-adjusted leader

ICICI Pru Liquid Fund – Regular – Growth has the highest Sharpe ratio at 7.68 and the highest Sortino ratio at 10.37 in the supplied performance dataset. HDFC Short Term Debt Fund – Regular – Growth has the highest alpha at 1.98.

6.2 Downside Risk & Tail Risk

Maximum drawdown, VaR and CVaR identify the severity of historical declines and adverse daily-return tails.

Figure 6.3 — Five schemes with the largest maximum drawdowns in the detailed max-drawdown output.

Scheme	Max drawdown	Worst date
SBI Small Cap Fund - Direct Plan - Growth	-52.6%	28 Oct 2025
Axis Small Cap Fund - Regular - Growth	-51.7%	11 May 2026
ABSL Small Cap Fund - Regular - Growth	-35.4%	11 May 2026
DSP Small Cap Fund - Regular - Growth	-31.2%	03 Jan 2025
SBI Small Cap Fund - Regular Plan - Growth	-28.7%	14 May 2025

Worst 95% VaR/CVaR observations

Scheme	VaR 95%	CVaR 95%
SBI Small Cap Fund - Direct Plan - Growth	-2.69%	-3.24%
Axis Small Cap Fund - Regular - Growth	-2.62%	-3.17%
ABSL Small Cap Fund - Regular - Growth	-2.60%	-3.25%
Nippon India Small Cap Fund - Regular - Growth	-2.54%	-3.23%
SBI Small Cap Fund - Regular Plan - Growth	-2.45%	-3.06%

VaR is the 5th percentile of daily returns, while CVaR is the mean of returns below that threshold, as specified in the advanced-analysis notebook. The most negative VaR in the supplied report is approximately -2.69% daily, with corresponding CVaR around -3.24% .

6.3 Benchmark, Correlation & Portfolio Structure

Relative performance and diversification measures complement absolute fund rankings.

Figure 6.4 — Benchmark comparison for the selected top-five funds against NIFTY 50 and NIFTY 100 in the supplied performance analysis.

Figure 6.5 — Return correlation among selected schemes and aggregate sector allocation across equity holdings.

Tracking error was calculated for five selected SBI schemes in the supplied report. The reported values range from 0.1333 for SBI Magnum Gilt Fund – Regular Plan – Growth to 0.2867 for SBI Small Cap Fund – Regular Plan – Growth. Lower tracking error indicates closer movement relative to the relevant benchmark.

Portfolio implication: The supplied EDA notes strong positive correlations among many large-cap funds, while the sector analysis shows concentration in Financial Services, Information Technology and Healthcare. Diversification therefore depends on genuinely different exposures rather than simply holding multiple similarly positioned schemes.

7. Investor Analytics

Transaction activity, geography, demographics and KYC status reveal the composition of the supplied investor sample.

32,778 transactions	19,716 SIP transactions	4,762 unique SIP investors	30,146 verified KYC records	66.3% T30 transaction share	₹3.52 bn total transaction value
-------------------------------	--------------------------------------	---	--	---	--

Investor Distribution: T30 vs B30 Cities

Figure 7.1 — T30/B30 distribution and SIP amount variation by age group.

Top states by transaction value

State	Transaction value
Punjab	₹315.8m
Tamil Nadu	₹315.2m
Madhya Pradesh	₹308.3m
Rajasthan	₹298.6m
Gujarat	₹298.4m
West Bengal	₹297.2m
Telangana	₹290.2m
Delhi	₹289.6m

The investor transaction file contains 92.0% verified KYC records. The most represented age group is 26–35, and T30 cities account for 66.3% of transaction records.

7.1 SIP Behaviour & Market Trends

SIP inflow growth is strong, while continuity analysis identifies a retention opportunity within eligible repeat-SIP investors.

Figure 7.2 — Monthly net inflow heatmap by mutual-fund category for the supplied category-inflow period.

Figure 7.3 — SIP amount by state in the supplied investor analysis.

SIP continuity

Of 4,762 unique SIP investors, 1,362 had at least six SIP transactions and were eligible for continuity analysis. The supplied advanced-analysis output classifies 1,332 as at-risk and 30 as regular, producing a 2.20% continuity rate and 97.80% at-risk rate under the project’s >35-day average-gap rule.

8. Advanced Analytics

The project extends descriptive analysis into tail risk, rolling risk-adjusted performance, investor cohorts and concentration.

Rolling Sharpe

A 90-day rolling Sharpe ratio was calculated for five key funds — Nippon Large Cap, Axis Bluechip, SBI Bluechip, ICICI Bluechip and Kotak Bluechip — to show how risk-adjusted performance changes through time. The supplied rolling-Sharpe chart is intended as a dynamic rather than static ranking measure.

Figure 8.1 — 90-day rolling Sharpe analysis for selected key funds.

Sector concentration (HHI)

Scheme	HHI
Axis Bluechip Fund - Regular - Growth	0.30
Mirae Asset Tax Saver Fund - Regular - Growth	0.25
HDFC Mid-Cap Opportunities Fund - Direct - Growth	0.25
UTI Flexi Cap Fund - Regular - Growth	0.25
DSP Midcap Fund - Regular - Growth	0.24

Axis Bluechip Fund – Regular – Growth has the highest HHI at 2967.69 in the supplied equity-fund output, followed by Mirae Asset Tax Saver Fund – Regular – Growth at 2549.92 and HDFC Mid-Cap Opportunities Fund – Direct – Growth at 2531.55. Higher HHI indicates greater concentration across sectors.

8.1 Cohorts, Continuity & Recommendation Logic

The project translates analytics into investor-retention and fund-selection utilities.

Investor cohort analysis groups investors by the year of their first transaction. The advanced-analysis notebook reports differences between 2024 and 2025 cohorts: the 2024 cohort has an average SIP amount of ₹10,996.89 and total invested amount of ₹2,258,062,304, while the 2025 cohort has an average SIP amount of ₹13,505.21 and total invested amount of ₹18,992,635. These figures are reported by the project notebook and should be interpreted within the supplied transaction window.

Simple fund recommender

- Accepts a Low, Moderate or High risk appetite.
- Filters schemes to the selected risk category.
- Ranks the remaining schemes by Sharpe ratio.
- Returns the top three funds for the selected risk category.

Input	Selection rule
Low	Top 3 by Sharpe
Moderate	Top 3 by Sharpe
High	Top 3 by Sharpe

Decision-support caution

The recommender is explicitly a simple Sharpe-based ranking within a risk category. It is an analytical utility, not a guarantee of future performance and should be read together with the project’s return, drawdown, benchmark and concentration measures.

Composite scorecard

Scheme	Score	3Y return	Sharpe	Alpha
ICICI Pru Midcap Fund - Regular - Growth	79.49	18.08%	1.18	0.29
Kotak Flexicap Fund - Regular - Growth	78.46	15.65%	1.31	0.27
HDFC Mid-Cap Opportunities Fund - Regular - Growth	75.64	16.58%	1.09	0.27
SBI Small Cap Fund - Regular Plan - Growth	75.00	23.39%	0.95	0.30
Mirae Asset Large Cap Fund - Regular - Growth	74.36	14.81%	1.45	0.27

Figure 8.2 — Supplied composite fund scorecard visualization.

9. Power BI Dashboard

The supplied project includes an interactive Power BI file and rendered dashboard pages.

The dashboard is organized into four major analytical pages: Industry Overview, Fund Performance, Investor Analytics and SIP & Market Trends. The ZIP also contains Dashboard.pdf with five rendered pages. The four principal dashboard screenshots are presented below as compact evidence of the reporting layer.

Page1 Industry Overview

Page2 Fund Performance

Page3 Investor Analytics

Page4 SIP Market Trends

Reporting layer

The dashboard consolidates industry overview, fund performance, investor analytics and SIP/market trends into an interactive presentation layer. The underlying analytical outputs in this report remain traceable to the supplied CSVs and project notebooks.

10. Key Findings

The following findings separate observed data patterns from calculated metrics and interpretation.

1 — SIP expansion

Evidence: Monthly SIP inflow rises from ₹11,517 crore in Jan-2022 to ₹31,002 crore in Dec-2025.

Interpretation: The series increases by about 169%, indicating strong expansion in systematic investment activity.

Why it matters: SIP growth is the clearest market-level trend in the supplied data.

2 — Folio expansion

Evidence: Total folios increase from 13.26 crore to 26.12 crore over the supplied Jan-2022 to Dec-2025 endpoints.

Interpretation: The increase is approximately 97%.

Why it matters: Investor participation expanded materially over the observation period.

3 — Return leadership

Evidence: SBI Small Cap Fund – Regular – Growth has the highest 3-year return at 23.39%.

Interpretation: The top three 3-year returns are 23.39%, 23.14% and 22.38%.

Why it matters: Return leadership is concentrated in small-cap schemes in this sample.

4 — Risk-adjusted leadership

Evidence: ICICI Pru Liquid Fund – Regular – Growth has the highest Sharpe ratio at 7.68.

Interpretation: Its Sortino ratio is also highest at 10.37.

Why it matters: The strongest risk-adjusted result is distinct from the highest-return result.

5 — Tail risk

Evidence: The most negative detailed maximum drawdown is –52.57% for SBI Small Cap Fund – Direct Plan – Growth.

Interpretation: The detailed max-drawdown output identifies 2025-10-28 as the worst date for that scheme.

Why it matters: Higher-return potential in the sample can coexist with materially larger drawdowns.

6 — SIP continuity

Evidence: Only 30 of 1,362 eligible investors are classified as regular under the project rule.

Interpretation: The reported continuity rate is 2.20%.

Why it matters: Retention/continuity is a major analytical opportunity within the supplied SIP cohort.

11. Insights & Recommendations

Recommendations are directly tied to patterns observed in the supplied analysis.

Priority 1 — Strengthen SIP continuity monitoring

Use the project's >35-day average-gap rule to create an operational watchlist for eligible SIP investors. The 97.80% at-risk rate in the supplied analysis suggests this should be the first retention metric to investigate.

Priority 2 — Separate return and risk leadership

Do not rank funds on 3-year return alone. Combine return, Sharpe/Sortino, alpha and drawdown because the supplied leaders differ by metric.

Priority 3 — Monitor concentrated portfolios

Use HHI alongside sector weights to flag schemes with comparatively high concentration, particularly where concentration coincides with high drawdown or volatility.

Priority 4 — Use benchma rk-relative measures

Track alpha, beta and tracking error alongside absolute returns to distinguish active outperformance from broad market movement.

Priority 5 — Segment investor engagement

Use age group, city tier, state and payment mode as descriptive segmentation variables when analyzing SIP activity and retention patterns.

Priority 6 — Preserve the pipeline/dash board linkage

Maintain the ingestion → cleaning → validation → SQLite → analytics → Power BI flow so dashboard metrics remain traceable to processed data.

These recommendations are analytical implications of the supplied data and project logic. They are not external market forecasts or claims about future fund performance.

12. Conclusion

Overall assessment and boundaries of interpretation

The Mutual Fund Analytics project provides a broad analytical view of 40 schemes, combining historical NAV behaviour, fund-house AUM, SIP flows, folio growth, investor transactions, portfolio structure and benchmark information. The supplied outputs demonstrate a complete workflow from data ingestion and cleaning to advanced risk analysis, recommendation logic and Power BI reporting.

The central conclusion is two-sided. At the market level, the supplied time series show strong growth in SIP inflows and folio counts. At the scheme level, performance is heterogeneous: SBI Small Cap Fund – Regular – Growth leads the 3-year return ranking, ICICI Pru Liquid Fund – Regular – Growth leads the Sharpe ranking, and the largest detailed drawdowns occur in small-cap-oriented schemes. Investor continuity is another major signal, with the project's rule classifying 1,332 of 1,362 eligible repeat-SIP investors as at-risk.

Limitations

- The report is limited to the datasets and analysis outputs supplied in the project ZIP.
- Different datasets have different observation windows; results should not be treated as if all series cover identical periods.
- Some advanced metrics are outputs of the supplied project notebooks/scripts and inherit their methodological assumptions, such as the 6.5% annual risk-free rate used for Sharpe calculations.
- The SIP continuity analysis applies only to investors with at least six SIP transactions and uses an average gap greater than 35 days as the at-risk rule.
- The simple recommender ranks by Sharpe within risk categories; it does not model suitability, future returns or investor-specific constraints.

Future scope

- Extend continuity analysis into predictive churn modelling using additional behavioural features.
- Add rolling downside-risk and benchmark-relative monitoring to the dashboard.
- Compare concentration, drawdown and risk-adjusted performance jointly at portfolio level.
- Automate refreshes so processed datasets and dashboard metrics update from the same validated pipeline.

Appendix A — Methodology & Data Dictionary

Selected methods documented in the supplied project.

Metric / process	Method documented in project
Daily return	(Today's NAV / Previous NAV) – 1
CAGR	Annualized compound growth calculated for 1-, 3- and 5-year periods
Sharpe ratio	(Return – risk-free rate) / volatility, annualized using $\sqrt{252}$; project specifies 6.5% annual risk-free rate
Sortino ratio	Excess return divided by downside standard deviation, annualized using $\sqrt{252}$
Alpha / Beta	OLS regression of fund daily returns against benchmark daily returns; annualized alpha from regression intercept
Maximum drawdown	Largest decline from historical peak NAV before recovery
VaR / CVaR	95% VaR = 5th percentile of daily returns; CVaR = mean of returns below VaR threshold
Rolling Sharpe	90-day rolling risk-adjusted return measure, annualized using $\sqrt{252}$
SIP continuity	Eligible investors have ≥ 6 SIPs; average gap > 35 days = at-risk
HHI	Sum of squared sector weights; higher HHI indicates greater sector concentration

Variable	Description
amfi_code	Unique AMFI scheme code
fund_house	Mutual fund company
scheme_name	Mutual fund scheme name
category / sub_category	Broad and detailed scheme classification
plan	Direct or Regular plan
risk_category / risk_grade	Project risk classification
nav / date	Net Asset Value and observation date
return_1yr_pct / return_3yr_pct / return_5yr_pct	Scheme return measures
alpha / beta	Benchmark-relative regression measures
sharpe_ratio / sortino_ratio	Risk-adjusted performance measures
max_drawdown_pct	Maximum drawdown measure in scheme-performance dataset
transaction_type / amount_inr	Investor transaction type and amount
state / city_tier / age_group / gender	Investor segmentation attributes
kyc_status	KYC verification status
sector / weight_pct	Portfolio sector and holding weight

Appendix B — Analytical Output Inventory

The ZIP contains the following key analytical artifacts used or reviewed for this report.

Artifact	Use
cleaned_01_fund_master.csv	Scheme master and classification context
cleaned_nav_history.csv	Historical NAV analysis
cleaned_03_aum_by_fund_house.csv	AUM trend analysis
cleaned_04_monthly_sip_inflows.csv	SIP trend analysis
